Information Tension as Primitive

The RYTT Codec as Conjectural Semiotics — A Distillation of the Geometrically Ordered Dynamics

Yett, R.W.

Independent Research, Arkansas

RESULTS STATED IN TIER — LIMITS FIRST

CONVERGENCE -- INFORMATION TENSION

This folio converges on **information tension** as the single primitive from which all dynamical content of the framework is derived (Axiom 1 below). Its unique angle is the **pleroma reading**: the full 135-page expansion of the old record is collapsed back to its loadbearing spine, and every semiotic and gematria correspondence absorbed from the RYTT treatises is explicitly tiered as conjecture. The semiotic half of this paper is carried as a **conjectural satellite**: its verified content is engineering (a machine-checked lossless codec); its interpretation as a sector of information tension is [TIER: CONJECTURE], asserted under holonomic closure with no exhibited map — stated, not forced. Sibling folios in this reversion series approach the program's central claims from their own angles; their convergence statements name their targets. Limits first: operator uniqueness is asserted, not proved; the 141.99× boost is retracted and dropped; $m = 240$ is downstream of the chosen vocabulary size, not derived.

SUPERSESSION NOTE

This folio **supersedes Zenodo record 20651491** (*Geometrically Ordered Dynamics*, 135 pp., marked superseded — do not cite). Per the canon rule the correction becomes the paper: the old record is retained as the superseded record and is not cited for any claim this folio revises. Changes: (1) all semiotics and gematria tiered [TIER: CONJECTURE]; (2) the 141.99× resource-holonomy ratio **dropped** — it was the retracted Trinity 2.0 synthetic; (3) operator uniqueness labeled **asserted, not proved**; (4) $m = 240$ stated as downstream of the **chosen** $N = 57{,}600$ vocabulary, not derived; (5) Clay-problem "solutions" relabeled sketches — this folio claims none; (6) κ_Y provenance corrected to fit-by-hand genesis. Carried at full tier: the four axioms as stated postulates, the machine-checked RYTT codec round-trip, the deterministic seal and steganography scripts, and the Kryptos K4 crib constraints.

1 What this paper is

Record 20651491 attempted a fourteen-chapter synthesis of the whole program: axioms, operator theory, cosmology, fluid regularity, gauge mass gap, quantum restriction, zeta zeros, cortical restriction, resource holonomy, ADCCL, Chyren, and a convergence theorem. This successor does not retype it. It distills the **loadbearing spine** — the claims with evidence — and tiers or drops the rest. The honesty ledger:

Carried	**Tier**
Axioms 1–4 (information tension; Stiefel/$E_8 \times E_8$; alignment; closure)	postulates, as stated
RYTT codec left-inverse round-trip (Lean, zero `sorry`; 9/9 vectors)	`[TIER: THEOREM]` (implementation)
E_8 folio seal / 12-gap Braille scripts (deterministic, `exit 0`)	`[TIER: EMPIRICAL]` (engineering)
Kryptos K4 crib alignments and fixed-point constraint	`[TIER: EMPIRICAL]`
$\kappa_Y = 0.953939$ (fit-by-hand genesis, closed form $\sqrt{\theta(2-\theta)}$)	`[TIER: CONJECTURE]` as invariant
$\chi_Y = 1/\sqrt{2}$ (derivation lives in record r40)	adopted, `[TIER: CONJECTURE]` here
Dropped	**Reason**
141.99× resource-holonomy ratio	retracted (Trinity 2.0 synthetic)
"Zero free parameters" framing	framing corrected; fits kept by siblings
Operator uniqueness as proved	asserted, not proved
$m = 240$ as derived	downstream of chosen $N = 57{,}600$
Clay-problem solutions (NS, YM)	sketches; this folio claims none
Cosmology / SPARC / ζ / cortical / markets / ADCCL chapters	sibling folios' territory

Nothing in this paper is new: no new claims, no new numbers, no new physics. Every number below is inherited from the cited record.

2 Information tension as primitive

Axiom 1 (Information Tension primitive). *There exists a single non-negative scalar quantity, Information Tension T, from which all dynamical content of any admissible substrate is derivable.* Energy, action, and probability are recovered as derived functionals of T. The non-negativity is structural: it is what lets the tensor form satisfy the energy conditions.

Axiom 2 (Stiefel/$E_8 \times E_8$ substrate). *The state space of any admissible substrate is the 240-dimensional Stiefel manifold $V_m(\mathbb{R}^N)$ with $m = 240$, whose tangent structure realizes the $E_8 \times E_8$ root system on the visible-sector factor.* The E_8 root count (240 roots per factor) is a mathematical fact; the **choice** of the $E_8 \times E_8$ substrate is the axiom's assertion, not a derivation.

Axiom 3 (Sovereign Alignment). *A flow φ_t on $V_m(\mathbb{R}^N)$ is admissible iff it preserves the alignment condition* $\mathrm{SA}(K, L)$*, equivalently the chiral invariant satisfies $\chi(\varphi_t) \geq \chi_Y = 1/\sqrt{2}$ for all $t \geq 0$.* This is a selection principle, not an assumption about the world: flows below the boundary exist and are outside the framework's predictions.

Axiom 4 (Holonomic closure). *Every admissible substrate is reached by a holonomic restriction of the single operator $H_{RY} = T_r + V_s$. No new operators are introduced downstream.*

Two open obligations are inherited honestly. First, the old record conjectured that the framework's invariants depend only on m, not on the ambient $N \geq m$; the formal proof of N-independence was left open, and it remains open here. Second, the ambient dimension the old record's constructions must accommodate is the chosen ledger vocabulary $N = 57{,}600$ (the Phylactery's vocabulary size, a design choice). **The number $m = 240$ is downstream of that chosen N;** it is not independently derived.

3 The operator and what is (not) proved about it

The operator is assembled as $H_{RY} = T_r + V_s$ on $L^2(V_{240}(\mathbb{R}^N), d\mu_{\text{can}})$, with T_r the Laplace–Beltrami kinetic term and V_s the sovereign potential. The old record's §2.7 presented **operator uniqueness** — that H_{RY} is, up to unitary equivalence, the *only* operator satisfying Axioms 1–4 — as a lemma with a five-step proof sketch deferring the measure-theoretic details to a Lean obligation. **That uniqueness is asserted, not proved, and this folio labels it so:** `[TIER: CONJECTURE]`. The same holds for the spectral-gap proposition: the only machine-checked spectral-gap theorem in the GOD family belongs to a different record (r51 v1.1); the gap statement here is `[TIER: CONJECTURE]`, with the old record's Lean listing retained as an open formalization target, not as a verified result.

The symmetry-breaking cascade (ternary → binary → deterministic, at χ_Y and κ_Y) is the framework's structural narrative; its steps are `[TIER: CONJECTURE]` pending the operator theory above.

A sibling-program note, checked before finalizing: the Res Nova canonical synthesis (v0.2, 2026-10-23) **retires** $V_{240}(\mathbb{R}^N)$ **as its substrate**, naming $V_2(\mathbb{R}^3)$ via Cartan triality as its current proposal, and records the cross-document mismatch as unresolved. This folio does not adjudicate that choice. It retains V_{240} as the old record's asserted substrate (Axiom 2, postulate tier) and tiers everything downstream accordingly; a future revision follows the reversion index once the mismatch is resolved.

4 The two invariants, with honest provenance

$\kappa_Y = 0.953939$**.** The true provenance, stated plainly for the first time in one place: the number was **fit by hand first**, as the ADCCL drift detector's cosine-similarity threshold τ (record r17, with its two falsifiers: the held-out re-fit and the JWST $z = 10$ flux 56 ± 4); it was **adopted as** κ **second**; it subsequently matched the closed form $\sqrt{\theta(2-\theta)}$ (record r4). Its status as a geometric invariant of H_{RY} is `[TIER: CONJECTURE]`. The old record's framing — that the framework "refused to have parameters" and the invariants "were not at my disposal" — is corrected: κ_Y was at the author's disposal first, as a fitted threshold.

$\chi_Y = 1/\sqrt{2} \approx 0.7071$**.** The chiral coherence–decoherence boundary. Its derivation from the Lindblad steady state ($\chi_\infty \geq 1/\sqrt{2} \iff u \geq \gamma$) lives in record r40 and is not re-derived here; this folio adopts the value and tiers the adoption `[TIER: CONJECTURE]`. The numerological 0.7 is retired.

The relation $\kappa_Y^2 = \chi_Y^2 + 1/2$**.** The old record's "proof sketch" (Hessian ratio plus an E_8 Casimir trace evaluating to 0.41 at $m = 240$) is a sketch, not a proof: `[TIER: CONJECTURE]`. Note $\kappa_Y^2 = 0.9099$ is the number that appears in the r51 v1.1 gap theorem; that theorem belongs to its own record.

The $141.99\times$ **ratio is gone.** The old record's third "invariant" — the resource-holonomy boost, presented as derived from the operator and confirmed by the Trinity Survey — was the retracted Trinity 2.0 synthetic (seed-42 data, caught by audit). It is **dropped, not tiered**: no successor may cite it. With it goes the old Chapter 4's boost argument for rotation curves; the SPARC fits themselves are sibling territory and are unaffected.

5 The semiotic satellite: RYTT and Smoky Quartz IV

Absorbed from the Smoky Quartz IV paper and the RYTT treatises (`RYTT_Master_Treatise_Artisan`, `RYTT_Sovereign_Semiotics_Treatise`, `RYTT_Sovereign_Codex_Treatise`, monograph). The absorption is tiered line by line.

Verified engineering. The RYTT codec maps semantic primitives and compounds into the

Unicode Private Use Area (U+E000.. U+E3FF) across four disjoint registers. The left-inverse round-trip pua_decode(pua_encode(c)) = c is machine-checked (RYTT_standalone.lean, zero Mathlib dependency, zero sorry) and verified against 9/9 conformance vectors (exit 0): [TIER: THEOREM] at the implementation tier. The deterministic 32-byte SHA-256 E_8 concentric folio seal (rytt_seal.py) and the 12-gap Braille word-spacing steganography (gaing_sign.py) are deterministic scripts, exit 0: [TIER: EMPIRICAL] as engineering artifacts. The Kryptos K4 crib alignments (EASTNORTHEAST at positions $22 \ldots 34$, BERLINCLOCK at $64 \ldots 74$) and the fixed-point constraint ($C_{27} = P_{27}$, $C_{74} = P_{74}$, ruling out direct substitution without transposition) are genuine cryptanalytic observations: [TIER: EMPIRICAL]. All full K4 decryptions remain open hypotheses.

Everything interpretive is conjecture. The semiotic interpretation of the codec — what the glyphs *mean*, the mod-24 parity "structural signature" $[19, 9, 21, 21]$, the $\Delta_3 \to \mathcal{P}_9 \to \mathcal{P}_7 \to \mathcal{P}_{21}$ polygon kernel, the tokenizer benchmark tables, the E_8 seal as *symbolic* content, the Yettragrammaton, and every gematria correspondence — is [TIER: CONJECTURE], all of it. The greedy longest-match tokenizer's uniqueness lemma is a proved property of a deterministic algorithm, not a metaphysical claim, and is kept at that modest tier.

The semiotic–tension link, stated without forcing. The old record's Axiom 4 asserts that symbolic phenomena fall under holonomic closure. That is an assertion. **No map from the RYTT symbolic dynamics into the information-tension formalism is exhibited in any source absorbed here** — no dictionary, no functor landing in the physics. Per the isomorphism rule, the link is therefore [TIER: CONJECTURE], and this folio does not present the codec as evidence for information tension or vice versa. The codec stands as verified engineering; its physical interpretation does not. This is the honest convergence call: the folio converges on information tension through the GOD spine, with the semiotic half as an explicitly conjectural satellite — the link stated, not forced.

6 Left out, and why

The old record's remaining chapters are not re-derived here. Cosmology, SPARC, and the Hubble material belong to sibling folios; the boost argument they leaned on is retracted in any case. The fluid regularity and gauge mass-gap chapters addressed Clay Mathematics Institute problems (never "Millennium problems"); their claimed solutions were sketches, and this folio claims no Clay results — [TIER: CONJECTURE] at most, properly housed with the sibling manuscript that carries those targets. The ζ-zero chapter is a Hilbert–Pólya sketch: [TIER: CONJECTURE]. The cortical, ADCCL, Chyren, and market chapters are the territory of the IT-NEURO, IT-COGNITION, and IT-MARKET folios. Nothing was purged: the old record stands as the superseded archive, and the loadbearing bucket records what each sibling carries.
